Francesco Stefanni, former labmate of Zhiyang Ong at University of Verona, who helped him craft $\text{\LaTeX}$ presentation slides.

The engineers of Mythic AI (Austin, TX) for showing us that analog in-memory computing is plausible, and their inspirational grit, from refusing to let their start-up go bankrupt multiple times, motivates us to be resilient in completing the IEEE SSCS Chipathon 2026 project.

Prof. Kaushik Sengupta at Princeton University and Prof. David Z Pan at The Awesome and Mighty University of Texas at Austin (trolling Aggieland haters, Go Longhorns!!!, Hook'em horns!!!) for inspiring us to craft AI-powered electronic design automation tools to kill IC design jobs.

References

Temporary page!

$\text{\LaTeX}$ was unable to guess the total number of pages correctly. If there was some unprocessed data that should have been added to the final page this extra page has been added to receive it. If you rerun the document (without altering it) this surplus page will go away, because $\text{\LaTeX}$ now knows how many pages to expect for this document.
